

Naira Bank Plc Ltd: Card Performance Dashboard FY2025

Executive Synopsis

Reporting Period: FY2025 | Data Scope: 10,000 transactions across 5 countries, 4 card types, ~2,000 customers

Total Spend (Net)	Approval Rate	Decline Rate
\$1.12M	90.66%	6.46%

1. Headline Performance

Naira Bank processed **10,000 transactions totaling \$1.12M** in FY2025, with a healthy **90.66% approval rate** and an average ticket of **\$135.53**. Volume followed a clear seasonal rhythm — softer in Jan/Feb/Apr/Jun, stronger in Mar/Jul/Sep/Nov — with cumulative spend climbing steadily to close the year on pace. Overall: a stable, well-functioning portfolio with no structural red flags.

2. Where Value Concentrates

Retail drives spend, contributing ~\$0.60M — more than double Premium's \$0.25M, with Corporate and Student trailing further behind. By category, **Travel & Airlines and Electronics lead** at \$217–218K each, reflecting a discretionary, higher-value skew, while Grocery, Dining, and Fuel anchor the routine, lower-value end.

Card-type distribution is structurally sound: Mastercard and Visa each hold ~35% of spend, matching their equal issuance weighting, with RuPay (17.52%) and Amex (11.58%) trailing proportionally — no single card type is outperforming.

India dominates volume, matching its larger domestic branch network, but the international footprint (UAE, Bahrain, Singapore, Hong Kong) still contributes a notable **23.51% cross-border share**. Notably, **UAE and Bahrain show higher average ticket sizes** (\$145.20 and \$138.56) than India (\$135.69) — fewer transactions, but higher value each, worth exploring for a targeted premium-segment strategy.

3. Where the Risk Sits

The overall **6.46% decline rate sits within the healthy 3–7% range** for card-present transactions, well below the 10–20% typical of e-commerce or recurring billing. Rates spiked seasonally between **June and August** (peaking at 7.82%) before falling sharply through Sept–Oct.

Suspected Fraud is the top decline reason, a genuine security priority. Encouragingly, decline rates are **consistent across all card types (6.16–6.62%) and all currencies** — confirming neither is a real risk driver; higher raw counts simply reflect higher volume.

One finding is directly actionable: **Card Expired declines are a preventable, bank-side gap** — distinct from customer-driven declines and from fraud — and warrant a direct process fix (proactive reissuance), not just monitoring.

4. Geographic Insight

Decline rates stay close across markets, but **UAE sits at the upper edge at 7.95%**, versus Hong Kong's low of 5.31%. Not alarming alone, but paired with UAE's higher ticket size, it points to a distinct risk-and-value profile worth monitoring as its own segment.

5. Recommendations

Reissue cards proactively before expiry — the one decline category fully within operational control, recovering spend currently lost to a preventable gap.

Investigate UAE's elevated decline rate — at 7.95%, not a crisis, but the one outlier worth a focused review.

Consider a differentiated approach for UAE and Bahrain — smaller volume but higher ticket sizes suggest an underserved premium opportunity, not a scaled-down version of the domestic offering.
